EDUCATION

- **Sir Syed University, Karachi** Karachi, Pakistan
CS in progress 2022 - 2026

EXPERIENCE

- **NCAI - NEDUET, Smart City Lab** Karachi, Pakistan
Internship March 2025 - Present
 - **Drop-out and GPA Model:** Built a model to predict students' GPA and dropout risk. Used a dataset from Kaggle, stored it on HDFS (Hadoop File System) due to its large size, and processed it using Apache Spark in Jupyter Notebook. The model was trained using linear regression, with features such as study hours and attendance to predict GPA. Based on the predicted GPA, the model determines whether a student will graduate or not.
 - **Crop Disease Classifier Model:** Developed a crop disease classifier that predicts whether crops are infected based on images. The dataset was taken from Kaggle and trained using models such as CNN, EfficientNet-B3, and MobileNet-B2. Achieved over 95 per accuracy across multiple crop models (Cotton, Corn, Wheat, Rice).
 - **Agronomist Chatbot:** Made a Web app just like ChatGPT in Next.js for farmer's assistance. Agentic AI model was implemented in the project for queries. All the chats were being stored in Neon Database. The Agent had the capability of remembering user conversation's by the help of session memory. Further I implemented the models I made for crop detection in it so the farmer's can upload picture of the crop and identify the disease.
 - **Traffic Speed Sign Detector:** I made a traffic sign detector using YOLOv8, Python, OpenCV, Numpy and Kaggle Notebook. Through the creation of this project, I was able to explore more of what object detection, real-time tracking, and computer vision pipelines can do.

PROJECTS

- **Super Market Management System in C-sharp:** Made this project in 3rd semester. This was made in Windows Form C-sharp and was focused for admin use only. You can add, delete and update products in this system. I made the entire project for admin panel to developing the system logic. Further more I made it's Database in MySQL and then linked it to the project.)
- **Agronomist AI:** Developed a Web-app in Next.js for assisting farmer's. By the help of Agentic Ai and trained models the app provides functionality of giving predictions on crops based on the uploaded images.
- **Portfolio Website:** Developed a personal portfolio website using Next.js to showcase projects and skills. Implemented responsive UI, smooth page navigation, and clean component-based architecture. Also Implemented the functionality to switch between Dark and Light mode in the project.

RESPONSIBILITIES

- **Team Leader:** I served as a group leader in University. Completed project's over-night and provided my group member's motivation to work.
- **Data Engineering and Databases:** Designed database schemas and wrote SQL queries for efficient data retrieval. Worked with structured and unstructured data to support analytical tasks.
- **Software Development and Collaboration:** Used Git/GitHub for version control and team collaboration. Debugged and optimized code to improve efficiency and performance. Also Documented project workflows, results, and technical processes clearly.
- **Research and Technical Exploration:** Explored modern tools, frameworks, and cloud platforms used in ML and Data Engineering. Researched industry's best practices to improve project quality and learning outcomes.

SKILLS

- **Languages:** Python, JavaScript, C++, C
- **Frameworks:** Next JS, Django, Fast API
- **Libraries:** Numpy, Pandas, Matplotlib, Seaborn, OpenCV
